What is interventional pain control?

Interventional pain control is a branch of medicine that uses minimally invasive procedures to treat chronic pain. These procedures are typically performed by pain management specialists, who have received specialized training in interventional pain management techniques.

Interventional pain control procedures can be used to treat a variety of chronic pain conditions, including:

- Cancer pain
- Back pain
- Neck pain
- Headaches
- Joint pain
- Nerve pain

How does interventional pain control work?

Interventional pain control procedures work by targeting the source of the pain. This may involve using injections to deliver medication directly to the painful area, or using radiofrequency ablation to destroy the nerves that are transmitting the pain signals.

Interventional pain control procedures are typically performed on an outpatient basis, which means that you can go home the same day. The procedures are usually well-tolerated, and most patients experience significant pain relief after treatment.

What are the benefits of interventional pain control?

Interventional pain control offers a number of benefits over traditional pain management methods, such as:

- **Long-lasting pain relief:** Interventional pain control procedures can provide long-lasting pain relief, which can significantly improve your

quality of life.

- **Reduced need for medication:** Interventional pain control procedures can help you reduce your need for pain medication, which can have a number of side effects.
- **Improved function:** Interventional pain control procedures can help you improve your range of motion and function, which can allow you to get back to your normal activities.

Who is a candidate for interventional pain control?

Interventional pain control is a good option for people who have chronic pain that has not responded to other treatments, such as medication, physical therapy, or chiropractic care.

If you are considering interventional pain control, your doctor will first evaluate your condition to determine if you are a good candidate for treatment. Your doctor will also discuss the risks and benefits of the procedure with you.

What are the risks of interventional pain control?

Interventional pain control procedures are generally safe, but there are some risks associated with the procedures, such as:

- **Bleeding**
- **Infection**
- **Nerve damage**
- **Allergic reaction**

Your doctor will discuss the risks of the procedure with you before you consent to treatment.
